Identifier les champignons transmis par les semences Rémi Champion, 1997 Pour la première fois en langue française, cet ouvrage présente les principales méthodes de détection et d'identification des champignons pathogènes transmis par les semences (potagères, fourragères, céréales et autres espèces de grande culture). Plus de 110 espèces fongiques font l'objet d'une fiche descriptive qui comprend : un rappel de la maladie, sa localisation sur la graine, les méthodes d'analyse disponibles, les critères d'identification, les symptômes présents au niveau des jeunes plantules et la fréquence d'apparition du champignon au cours des années. Ce livre est destiné tout particulièrement aux ingénieurs et techniciens chargés du contrôle de la qualité des semences. Il s'adresse aussi aux étudiants, aux expérimentateurs de terrain, aux agriculteurs multiplicateurs et, d'une manière générale, à tous les utilisateurs de semences.

Fodder Crops and Amenity Grasses Beat Boller, Ulrich K. Posselt, Fabio Veronesi, 2010-01-14 Grassland farming in Europe was already established during the settlement of the first farmers together with their domesticated animals after the last ice age. Since then, grassland provides the forage basis to feed ruminant animals for the production of meat and milk. Depending on the ecological conditions and intensity of usage, various plant communities with different species developed,

displaying a rich biodiversity. With the introduction of improved crop rotations at the end of the 16th century, grasses and legumes were also grown to an important extent as forage crops on arable land. In the last decades the importance of amenity grasses increased markedly, due to the demand of the society for new usages like landscape protection. Around 1900 interested farmers and academics identified the need for grassland improvement through systematic selection and seed production. This marks the beginning of breeding and research in companies but also at universities and specialized research institutes. Plant collection started with many of the species that are still of importance today. The collected materials were grouped according to the intended use and some type of phenotypic selection was applied. Seed multiplication of such populations was performed in pure stands and the harvested seed was marketed. Although the vegetative biomass and its quality are of utmost importance in forage crop breeding, it is the seed yield potential which determines the commercial success of a new variety.

The Model Legume *Medicago truncatula*, 2 Volume Set Frans J. de Bruijn, 2020-01-29 Fully covers the biology, biochemistry, genetics, and genomics of *Medicago truncatula*. Model plant species are valuable not only because they lead to discoveries in basic biology, but also because they provide resources that facilitate translational biology to improve crops of economic importance. Plant scientists are drawn to models because of their ease of manipulation, simple genome organization, rapid life cycles, and the availability of multiple genetic and genomic tools. This reference provides comprehensive coverage of the Model Legume *Medicago truncatula*. It features review chapters as well as research chapters describing experiments carried out by the authors with clear materials and methods. Most of the chapters utilize advanced molecular techniques and biochemical analyses to approach a variety of aspects of the Model. The Model Legume *Medicago truncatula* starts with an examination of *M. truncatula* plant development; biosynthesis of natural products; stress and *M. truncatula*; and the *M. truncatula*-*Sinorhizobium meliloti* symbiosis. Symbiosis of *Medicago truncatula* with arbuscular mycorrhiza comes next, followed by chapters on the common symbiotic signaling pathway (CSSP or SYM) and infection events in the Rhizobium-legume symbiosis. Other sections look at hormones and the rhizobial and mycorrhizal symbioses; autoregulation of nodule numbers (AON) in *M. truncatula*; *Medicago truncatula* databases and computer programs; and more. Contains reviews, original research chapters, and methods. Covers most aspects of the *M. truncatula* Model System, including basic biology, biochemistry, genetics, and genomics of this system. Offers molecular techniques and advanced biochemical analyses for approaching a variety of aspects of the Model Legume *Medicago truncatula*. Includes introductions by the editor to each section, presenting the summary of selected chapters in the section. Features an extensive index, to facilitate the search for key terms. The Model Legume *Medicago truncatula* is an excellent book for researchers and upper level graduate students in microbial ecology, environmental microbiology, plant genetics and biochemistry. It will also benefit legume biologists, plant molecular biologists, agrobiologists, plant breeders, bioinformaticians, and evolutionary biologists.

The Deuteromycetes - Mitosporic Fungi E Kiffer,M Morelet,2011-09-23 The work presented here is based on the modern classification of this group. Barring some tropical examples, it covers essentially genera found in the temperate zone of the Northern hemisphere. The book will interest medical and veterinary mycologists, phytopathologists, food scientists, and ecologists.

Breeding strategies for sustainable forage and turf grass improvement Susanne Barth,Dan Milbourne,2012-07-25 From the 4th - 8th of September 2011, the Eucarpia Fodder Crops and Amenity Grasses Section, held its 29th Meeting in the surroundings of Dublin Castle in Ireland. The theme of the meeting was 'Breeding strategies for sustainable forage and turf grass improvement'. Grasslands cover a significant proportion of the land mass of the world, and play a pivotal role in global food production. At the same time we are faced with several challenges that affect the way in which we think about this valuable set of resources. The population of the world is expected to exceed 9 billion by 2050, and increase of about one third relative to today's levels. This population increase will be focused in urban areas, and in what are currently viewed as "developing" countries, meaning that the buying power of this increased population will be greater - shifting the balance of demand from staple crops to high value items such as meat and dairy products. Overall that the world will have to approximately double agricultural output across all categories of food to meet the demands of this larger, urbanised population. This is occurring against a backdrop of equally large challenges in terms of global climate change. Agriculture is already a significant contributor to e.g. greenhouse gas emissions, deforestation and soil erosion. The situation is made more complex by an increased emphasis on biofuels as a solution for our imminent oil shortage, resulting in increased competition between land utilised for food and fuel. In short, agriculture must continue to feed the world, whilst not contributing to damaging it further. It must be sustainable. Plant breeding plays a significant but frequently understated role in meeting the challenges presented by this complex and changing scenario. However, plant breeding and improvement is itself undergoing radical change driven by technology. This book explores how forage and turf breeding is changing and adapting to meet these challenges using the technological advances being experienced in plant breeding as a whole.
